

Lan Pya

Research Verdict

A clear stakeholder Q&A; on the first product, why it should start narrow, and how verified work can connect learners to real opportunities.

THE VERDICT

Keep STEM as the mission. Launch the first product as a **digital-STEM Proof-to-Opportunity Engine**, beginning with **Frontend Web Development**.

The first promise

A learner can show what they can do, understand what is still missing, and see which opportunities they are ready for.

The design principle

AI may assist assessment and personalization, but it must not become an invisible or unaccountable gatekeeper.

01 / EXECUTIVE ANSWER

What are we actually deciding?

The mission can be broad. The first product cannot. Lan Pya needs one credible journey that proves learner value and partner value end to end.

Q

What is the one-sentence product decision?

DECISION LOCKED

A

Lan Pya is a **Proof-to-Opportunity Engine**, not another learning management system. It helps a learner diagnose current ability, follow a trusted route, complete realistic work, receive transparent feedback, publish verified evidence, and understand which opportunities are within reach.

Q

Does this abandon the STEM mission?

DECISION LOCKED

A

No. STEM remains the long-term mission and portfolio direction. The narrow opening is a sequencing choice: prove the model in one digital-STEM role before adding Full-Stack Development and AI/Data Analysis.

THE PRODUCT LOOP

- 1

Diagnose
Establish a baseline without forcing learners to repeat what they already know.
- 2

Choose a role
Start with a concrete employment direction, not a generic subject list.
- 3

Follow a roadmap
Use an expert-owned competency graph adapted to the learner.
- 4

Complete realistic work
Produce practical evidence, not only quiz scores or attendance.
- 5

Receive transparent feedback
Apply visible rubrics, explain scores, and allow revision.
- 6

Publish verified evidence
Build a controlled, shareable portfolio and competency profile.
- 7

Unlock matched opportunities
Explain why the learner qualifies and what remains missing.

BOTTOM LINE

Lan Pya is not selling more content. It is organizing the path from learning to credible evidence to opportunity readiness.

02 / WHY THIS OPENING

Why not launch a broad STEM platform?

The evidence points to an execution gap between learning and opportunity - not simply a shortage of course pages.

Q	What problem is urgent for learners?
A	Myanmar's formal job market is constrained, especially for educated young people. Learners need clearer career direction, skills that map to real roles, and credible routes into remote, gig, internship, scholarship, and junior-work opportunities.
Q	What problem is urgent for firms and partners?
A	Employers still report difficulty attracting suitable applicants. The research record cites an October 2025 survey in which 18% of firms reported vacancies ; among firms hiring, 48% had difficulty attracting employees , including because applicants lacked required skills. Partners need better evidence than course completion alone.
Q	Why will another course catalogue or job board not be enough?
A	Myanmar already has learning platforms, course providers, AI tutors, STEM communities, and job boards. Existing examples already cover project-based education, recruitment connections, job discovery, and applications. Lan Pya's differentiation must be the connective layer: trusted sequencing, realistic work, verified evidence, and explained readiness.

Market constraint	Global pattern
Only 44% of Myanmar's population was online in January 2025. Affordability, restrictions, outages, and unstable connections make low-data and resumable access a product requirement.	Forage demonstrates the value of realistic work simulations, model answers, certificates, and recruiter connections. Lan Pya can localize the pattern and add trusted sequencing.

STRATEGIC CHOICE	Choose a category that is narrow enough to operate credibly and valuable enough that learners and partners can immediately understand the outcome.
-------------------------	--

03 / PRODUCT AND LEARNER

Who is the first product for?

The opening user is a learner pursuing a demonstrable digital role, with access constraints and uneven prior experience.

Q

Which product category won, and what was rejected?

DECISION LOCKED

A

The selected category is the **Proof-to-Opportunity Engine**. A broad personalized STEM learning platform was rejected because it is content-heavy and crowded. A STEM career super-app was rejected because courses, mentors, scholarships, internships, jobs, remote work, and migration guidance are too much to validate and operate at once.

Q

Which first track and first role should Lan Pya target?

DECISION LOCKED

A

Start with **Software Engineering**, specifically **Frontend Web Developer**. The competency set is understandable and the work is highly demonstrable: HTML, CSS, responsive design, JavaScript, Git/GitHub, accessibility, APIs, deployment, portfolio work, and interview preparation.

TRACK SEQUENCE

01	Frontend Web Developer	Launch track
02	Full-Stack Developer	Next, when operationally ready
03	AI/Data Analyst	Later, after stronger validation

Q

What is the rule for adding later tracks?

DECISION LOCKED

A

A track launches only when its competency graph, practical tasks, visible rubrics, reviewer capacity, and relevant opportunity supply are ready. A track name on a menu is not the same as an operational product.

04 / TRUST AND VERIFICATION

What counts as verified proof?

Trust comes from layers, transparency, and recourse - not from pretending an AI score is automatically objective.

Q

Can AI decide whether a learner is qualified?

DECISION LOCKED

A

Not by itself. Fully automated decisions are fast but unsafe for real opportunity access. Human-only review is trusted but too slow and expensive. Lan Pya will use **layered verification** so that speed and accountability reinforce each other.

THE VERIFICATION STACK

LAYER	WHAT IT DOES	WHY IT EXISTS
1. Deterministic checks	Confirm required files, links, fields, and expected functionality.	Catch clear omissions consistently.
2. AI rubric review	Score against a visible rubric and explain each score.	Give fast, structured first feedback.
3. Human review	Handle low-confidence, disputed, or high-stakes submissions.	Protect fairness and opportunity access.
4. Learner recourse	Allow revision, resubmission, and appeal.	Make verification developmental, not punitive.
5. Quality audit	Lan Pya audits partner decisions and rubric consistency.	Keep standards aligned over time.

Q

Who makes high-stakes decisions?

DECISION LOCKED

A

AI performs the first review. Trained partner reviewers make high-stakes decisions using shared rubrics. Lan Pya audits quality and manages appeals. This keeps responsibility visible and prevents silent model judgment from controlling access.

TRUST PRINCIPLE	Every score must be explainable, every standard must be visible, and every learner must have a path to improve or challenge a decision.
-----------------	---

05 / OUTCOMES AND ROADMAPS

What does verified proof unlock?

The first promise is credible readiness and controlled evidence - not a guaranteed internship before employer commitments exist.

Q What is the first learner outcome?

DECISION LOCKED

- A A passing task creates a **shareable verified portfolio**, a **competency profile**, and an **opportunity-readiness report**. The report shows which opportunities the learner qualifies for, why they qualify, and which gaps remain.

Q Why not promise direct internship eligibility immediately?

- A That promise depends on committed employers and clear selection rules. Until those relationships are operational, Lan Pya should make the strongest claim it can verify itself: the learner has produced rubric-backed evidence and meets stated criteria for matched opportunities.

Q Where should opportunities come from?

DECISION LOCKED

- A Use a **curated opportunity registry** managed by Lan Pya administrators and approved partners. Each listing must include eligibility criteria, source link, deadline, location or remote status, cost, safety notes, and a last-verified date. Expired opportunities disappear automatically.

Q Why not automatically aggregate job boards?

- A Automatic aggregation increases quantity but also brings stale listings, duplicates, scraping restrictions, and weak quality control. The first product should optimize for trustworthy matching, not a large but unreliable listing count.

Q How are personalized roadmaps kept trustworthy?

DECISION LOCKED

- A Experts own the competency graph: skills, dependencies, evidence standards, and rubrics. AI may adapt placement, pacing, explanations, and resource suggestions, but it cannot invent qualifications or silently change requirements.

06 / ACCESS, PRIVACY, AND MODEL

How should Lan Pya work in the real context?

Connectivity, safety, and affordability are not edge cases. They shape the delivery model from the beginning.

Q How will learners access the product?

DECISION LOCKED

A Through a **bilingual, mobile-first Progressive Web App** in Burmese and English. It should be installable from the browser, use low-data screens, cache roadmaps and task instructions, resume uploads, and show clear offline status.

Q Why not a standard website or native Android app?

A A standard responsive site is faster but offers weak support during outages. A native Android app can go deeper offline but creates a second codebase and slows the first launch. A PWA is the best first balance of reach, resilience, and delivery speed.

Q Are portfolios public by default?

DECISION LOCKED

A No. Profiles and evidence are **private by default**. Learners may use an alias, keep evidence private, and create revocable portfolio links. Verified identity is stored separately and disclosed only with learner consent for a specific opportunity.

Q Who pays?

RECOMMENDED -
SIGN-OFF PENDING

A The recommended model is **sponsored cohorts**. Universities, training organizations, NGOs, scholarship programs, and employers pay for cohort management, verification, analytics, and talent access. Core learner features remain free.

Editorial note: Sponsored cohorts are marked recommended in the supplied decision record, but no final lock is recorded.

Why not learner subscriptions?

Affordability is constrained and the willingness-to-pay evidence is still hypothetical. Charging learners first would undermine access and add payment complexity.

Why not pay per placement?

Revenue would arrive late and could pressure the product to optimize placement quantity over learner welfare and trustworthy matching.

07 / SUCCESS AND FIRST RELEASE

How will we know the product works?

Measure the behavior Lan Pya directly creates now, while keeping employment outcomes as the long-term test.

Q What is the north-star metric?

DECISION LOCKED

A **Verified Evidence Rate**: the percentage of active learners who complete a milestone and add rubric-backed, employer-readable evidence to their portfolio.

Q Why not count roadmaps generated?

A A generated roadmap measures curiosity, not progress. Verified evidence measures whether a learner moved from intention to demonstrated capability. Jobs and internships remain the eventual outcome metric, but they are slower and affected by market conditions outside Lan Pya's control.

Q What should be genuinely operational by the August 20 milestone?

RECOMMENDED -
SIGN-OFF PENDING

A Choose the **operational vertical slice**: real authentication and persistent data; Frontend placement and roadmaps; task submission; layered verification; reviewer workflow; private and shareable portfolios; curated opportunities; partner/admin tools; and a bilingual responsive PWA. Full-Stack and AI/Data can appear only as clearly labeled upcoming tracks.

Editorial note: Option B is marked recommended in the supplied decision record, but no final lock is recorded. Treat this as the proposed release scope until stakeholders formally sign off.

WHAT THIS RELEASE MUST PROVE

- + A real learner can move from baseline assessment to a role-specific roadmap.
- + A learner can submit practical evidence and receive explainable, rubric-based feedback.
- + A reviewer can handle exceptions, high-stakes decisions, and appeals.
- + A learner can control a shareable portfolio and see explained opportunity matches.
- + A partner can manage a cohort and observe evidence-producing progress.

08 / DECISION REGISTER

What is locked, and what still needs confirmation?

This register separates durable product choices from recommendations that remain formally unconfirmed in the supplied record.

AREA	DECISION	STATUS
Category	Proof-to-Opportunity Engine, not an LMS	LOCKED
First track	Software Engineering	LOCKED
First role	Frontend Web Developer	LOCKED
Verification	Deterministic checks + AI rubric + human review + appeal	LOCKED
First outcome	Verified portfolio, competency profile, readiness report	LOCKED
Opportunities	Curated, criteria-based, last-verified registry	LOCKED
Roadmaps	Expert competency graph with bounded AI adaptation	LOCKED
Delivery	Bilingual, mobile-first, low-data PWA	LOCKED
Privacy	Private by default; revocable sharing; consent-based identity	LOCKED
Commercial model	Sponsored cohorts; core learner features free	SIGN-OFF
North star	Verified Evidence Rate	LOCKED
August 20 scope	Operational Frontend vertical slice	SIGN-OFF

SCOPE
GUARDRAIL

Do not call a feature operational unless the underlying data, workflow, standards, reviewer ownership, and learner recourse are real.

09 / STAKEHOLDER DISCUSSION

What should peers confirm next?

The strategy is coherent. The next conversation should test operating commitments, not reopen the entire product category without new evidence.

QUESTIONS FOR SIGN-OFF

- + Do we formally approve the August 20 operational vertical slice as the release scope?
- + Do we formally approve sponsored cohorts as the initial commercial model?
- + Who owns the Frontend competency graph, tasks, rubrics, and change control?
- + Which submissions require human review, and what is the response-time target?
- + Which partners will supply the first sponsored cohort and curated opportunities?
- + What minimum offline behavior must work before the release is considered credible?
- + What learner-safety, identity, portfolio-sharing, and appeal policies must be approved?

DECISION TEST

If a proposed feature does not help a learner create trusted evidence, understand readiness, or reach a verified opportunity, it is probably not part of the first release.

RESEARCH SOURCES IN THE SUPPLIED VERDICT

World Bank - Graduate aspirations in Myanmar

Career counseling, vocational alignment, and access to remote and gig work.

World Bank - Firm Monitoring Survey

Vacancies and difficulty attracting applicants with required skills.

World Bank - Myanmar Economic Monitor

Connectivity, affordability, restrictions, and outage context.

Myanmar Cyber Youths

A local example of mobile-first, project-based technology education and recruitment connections.

JobNet Myanmar

A local example of job discovery and applications.

Forage

A global reference for realistic work simulations, feedback artifacts, certificates, and recruiter connections.

Editorial note: This document reorganizes and clarifies the supplied research verdict. It removes duplicated text, converts decision options into stakeholder questions, and does not add independent market findings.
